Foreword

It is my pleasure to join you on October 23, 2001 in the Labrador Region to get your perspective on the current and future health and well-being of the residents in the Labrador Region of this Province. It is our hope that through discussion with stakeholders in the Regions that we can begin to address the many issues facing health and community services in our Province.

The vast geography of Newfoundland and Labrador, with its many dispersed communities, provides its own particular challenge for service delivery. Residents of the Labrador Region make up 4.6 percent of the population of the Province, distributed throughout 18 diverse communities.

Throughout Health Forums 2001, we are conscious that budgetary considerations are an issue for all regions of the Province, and thus, we must determine how to address this to the best advantage of all concerned. While at one time the population of Newfoundland and Labrador was the youngest in the country, it is now aging more rapidly than most other provinces. This too makes us constantly aware that we need to rethink how we provide services.

Your input into this process is very important and I would personally like to thank you for your interest and participation.

Julie Bettney, MHA
Minister of Health and Community Services
Introduction

LABRADOR REGIONAL HEALTH SERVICES BOARD

The Labrador Region includes central and western Labrador, and coastal Labrador north of, and including, Black Tickle.

Since 1991, the population of the Labrador Region has decreased slightly from 26,463 to its current population of 23,840 and, unlike any other region of the Province, it is anticipated that the population will increase to 24,584 by 2016. The map on the inside front cover provides an indication of the population distribution throughout the Region, with 80 percent of residents living in Labrador City and Happy Valley-Goose Bay, or surrounding area.

The reasons for the population decline in the Labrador Region are slightly different than for the Province as a whole, being more heavily tied to out-migration and less so to birth rates and mortality rates. The Labrador Region has been the second hardest hit region, overall, by out-migration, with noticeably higher losses than the Province as a whole in many age categories. Unlike most other regions, the net out-migration in the Labrador Region is largest between the ages of 15 and 29. Almost 22 percent of the 15 to 19 year-olds in the Region in 1991 migrated out of the Region before they reached the ages of 20 to 24 in 1996. There have also been high levels of out-migration between the ages of 50 and 64. This is typical of a region where individuals relocate from other regions or provinces for work and leave again once they conclude their employment.

The Labrador Region is also unique in that it is the only Region outside of St. John’s where overall population growth is predicted in the next 15 years. This is due to an anticipated slowing of out-migration, ongoing in-migration necessary to fill the vast number of new and continuing trades positions in the Region, and higher fertility rates and lower mortality rates than other areas of the Province.
Another interesting element of the population breakdown is the age distribution. The Labrador Region is currently younger than other regions of the Province, with less than five percent of its residents being over the age of 65. Again, this is undoubtedly due to the substantial out-migration of individuals over the age of 50. While the proportion of individuals over the age of 65 is expected to grow, it will continue to be significantly lower than the rest of the Province in 2016.

WHAT IS POPULATION HEALTH?

Nationally and provincially there is strong support for using a population health approach to guide the current and future direction of the health and community services (HCS) system. As an essential component of all health policy, a population health approach aims to improve the health of the entire population and to reduce health inequities among population groups. A population health approach reflects the evidence that factors outside the health care system, or sector, significantly affect health. It considers the entire range of individual and collective factors and conditions - and their interactions - that have been shown to be correlated with health status. These factors are commonly referred to as the Determinants of Health. Crucial to this definition is the notion that these factors do not act in isolation of each other. It is the complex interactions among these factors that have an even more profound impact on health.

A population health approach recognizes that any analysis of the health of the population must extend beyond an assessment of traditional health status indicators like death, disease and disability. A population health approach establishes indicators related to mental and social well-being, quality of life, life satisfaction, income, employment and working conditions, education, and other factors known to influence health. With this in mind, this document has been prepared to provide you with an initial description of the Labrador Region from a health determinants perspective. It is hoped that this first Departmental endeavor at compiling such a broad array of relevant information will inform the Health Forums 2001 consultations and be a useful tool in the decision-making process ahead.
Health services, particularly those designed to maintain and promote health, to prevent disease, and to restore health and function, contribute to population health.

STRUCTURE OF THE REGIONAL HEALTH AND COMMUNITY SERVICES SYSTEM

One Regional Health Board provides the majority of publicly funded health and community services in the Labrador Region. Other services, such as the women’s shelter and group homes, are funded through the Provincial Health and Community Services Budget but have separate governance structures. Three aboriginal health commissions - The Labrador Inuit Health Commission (LIHC), the Mushuau Innu Health Commission and the Sheshatshiu Innu Health Commission, funded primarily by the Federal Government, also deliver community-based services in select communities. In addition, medical services, which includes both primary and specialist services, make up a significant portion of the services available to residents in the Region.

The Health Labrador Corporation is one of two regional health boards in the Province that provides a comprehensive range of services under one administrative structure. This integrated board is responsible for acute (hospital) care, long-term care, community health programming and the recently amalgamated community services component. The Board provides some services throughout the entire Region, including all acute care and residential nursing care. Other services such as community health are partially delivered by the aboriginal health commissions in some communities and the Board in others.

Health Labrador Corporation operates 13 facilities including two hospitals, one nursing home, eight nursing stations and two community clinics. A full range of community-based services is delivered in seven communities in the Region. The Board is responsible for 42 acute care beds and 54 long-term care beds. In 1999/00 the organization managed 2,236 admissions/discharges and 35,000 emergency visits. Three hundred and twenty-four babies were born at facilities in the Region.

Community-based programming is primarily delivered by social workers, nurses and other allied health professionals, such as nutritionists and occupational therapists. Community service workers are a vital component of the aboriginal service delivery model. A more comprehensive overview of the services and facilities in the Labrador Region can be found on page seven of this document.

Primary care medical services are provided by approximately 20 family doctors throughout the Region. Midwives, nurse practitioners and regional nurses also contribute significantly to the provision of primary health care. A primary health care enhancement project, situated in Happy Valley-Goose Bay, is demonstrating the value of an interdisciplinary approach to primary care. Specialized medical services are provided by roughly five specialists who are based at the two hospitals.
THE COST OF HEALTH AND COMMUNITY SERVICES IN THE LABRADOR REGION

Within the Labrador Region, the total program expenditures in health and community services were $51,898,928. This represents approximately 4.1 percent of the Province’s total regional health and community services program expenditures. It does not include Federal funding agreements with the various aboriginal groups.

When the expenditure breakdown is examined, a number of observations can be made. As with other regions in the Province, the cost of institutional services accounts for the majority of program spending. For the Health Labrador Corporation, institutional care accounts for over 53 percent of program spending, which is significantly less than the 62 percent spent by the Province as a whole. Spending on community-based services also demonstrates regional/provincial differences. Within the Health Labrador Corporation, just under 20 percent of the regional expenditure is devoted to community health and other community services. As a Province, about 16 percent of the total program spending is allocated to community-based programming. Spending on medical services also shows the same trend, with Health Labrador directing about 20 percent of its resources for physicians, compared to 16 percent for the Province as a whole.

A number of factors have been identified both provincially and nationally as significant contributors to rising costs in the health sector. The Labrador Board is impacted by these realities as well. The cost of technology, pharmaceuticals and identified programs, such as home support, put major pressure on a system that is struggling to deliver quality services.

HEALTH AND COMMUNITY SERVICES SECTOR ACTIVITY IN THE LABRADOR REGION

Although it is difficult to accurately measure the type, level, and quantity of services delivered in the Labrador Region, the following information provides us with some useful knowledge about our HCS system. While most of the material provided applies to the institutional sector only, efforts are ongoing to develop data collection systems for community programming areas.

The Health Labrador Corporation is active from both an inpatient and outpatient perspective. In addition to over 2,200 admissions/discharges and busy emergency services, the organization performed over 1,000 outpatient operating room visits in the fiscal year 1999/00.

Labrador Inuit Health Commission
- Serves the Inuit in the communities of Happy Valley-Goose Bay, Hopedale, Makkovik, Nain, North West River, Postville and Riglolet.
- Provides a range of community health programming, including: public health nursing, diabetic education, home support, addictions, mental health and family services
- Accesses Health Labrador Corporation for other community-based services, nursing, home care and all acute care services

Mushua Innu Health Commission
- Serves the Innu of Davis Inlet
- Provides a range of community health programming, including: public health nursing, diabetic education, home care, addictions, mental health and family services

Sheshatshiu Innu Health Commission
- Serves the Innu of Sheshatshiu
- Provides a range of community health programming, including: public health nursing, diabetic education, home care, addictions, mental health and family services

Labrador Region Quick Facts
- Population: 23,840
  - 0-14: 22.4%
  - 15-64: 73.0%
  - 65+: 4.6%
- 7 HCS Offices/Clinics in 7 communities
- 42 Acute Care Beds
  - Comprising approx. 2% of all acute care beds in the Province
- Average Length of Stay: 4 days
- 54 Long-Term Care Beds
  - Comprising approx. 2% of all long-term care beds in the Province
- Physicians:
  - General Practice: 20
  - Specialists: 5
- Nurses: 145
- Licensed Practical Nurses: 54
- Laboratory and X-Ray: 21
- Social Workers: 14
When outpatient surgeries are examined from the perspective of procedures that were performed on residents from the Labrador Region (and not from the facility that performed them) a number of trends are evident. For the seven most common surgical day procedures, comprising a total of 660 surgical interventions; 12 percent were performed on individuals under the age of 20 years. Of that number, 67 percent involved the insertion of tubes in the ears (myringotomy). Individuals age 65 and over underwent 66 procedures (10%), of which nearly half (47%) were endoscopies. Adults in the middle age range were the recipients of over three-quarters (79%) of all procedures performed. Males underwent slightly more procedures than females (51% vs. 49%) when D & C was not included. When the D & C procedure was included, the number of females exceeded the number of males (369 procedures or 56% vs. 291 procedures or 44%).

**Hospital Discharges by Reason for Hospitalization (1999/00)**
When hospitalization patterns for a range of common health conditions are explored for residents of the Labrador Region, a number of interesting trends emerge. One-third of all hospital admissions/discharges were experienced by individuals age 65 years and older (32.1%). Of that number, 68 percent of the hospital stays related to circulatory disorders. Adults in the middle age range accounted for 59 percent of hospital admissions/discharges. The disorders most commonly responsible for hospital stays in that age group were: circulatory disorders (57.6%), diabetes (13.6%), mental illness (6.8%), and asthma (6.1%). Children, 19 years of age and younger, comprised 8.9 percent of all admissions. Asthma and diabetes accounted for 95 percent of all hospitalizations for young people.

A gender analysis highlights some interesting findings. The majority of individuals who were admitted for cancer, disorders of the circulatory system and diabetes were male (77.7%, 68.3% and 59.4%, respectively). Women were more often admitted for mental illness and total hip replacement, although overall numbers were low. In total, 38.8 percent of all discharges for these identified conditions were female. This trend holds true for all age groups, with more males being hospitalized in all age categories.

The publicly funded immunization programs in Newfoundland and Labrador include childhood and adult immunizations. Childhood vaccines protect against tetanus, diphtheria, polio, whooping cough, haemophilus influenzae B, measles, mumps and rubella (DPTP/Hib & MMR) in a series of six visits between the ages two months and five years. School programs include hepatitis B and a booster for tetanus in Grade Four, and diphtheria and whooping cough (TdaP) in Grade Nine. Since 1999, Level 2 students have been receiving a second dose of measles, mumps, and rubella vaccine. Adult immunizations protect against influenza and pneumococcal disease. These immunization programs are provided by community health nurses and physicians in all six regions of the Province and continue to obtain excellent coverage.

As we move to providing more and more acute services in an ambulatory setting, one indicator that provides some direction for these decisions is known as “May Not Require Hospitalization” (MNRH). This indicator, the percentage of cases classified as MNRH, is used to flag diagnoses where treatment may be provided on an outpatient basis. It is a useful screening tool that alerts an organization when a review of admissions/discharges may be in order to identify opportunities for more appropriate utilization. Calculation of this percentage for the province as a whole reveals that in 1999 11.4 percent of hospital admissions/discharges were categorized as MNRH. This percentage dropped slightly in 2000 to 11.1 percent. Results for residents of the Labrador Region were slightly higher than for the Province as a whole with 12.5 percent of discharges being flagged for further study. Of that figure, 9.4 percent of the admissions/discharges occurred in facilities within the Labrador Region, while 3.1 percent occurred in facilities outside the home region.
HUMAN RESOURCE ISSUES

The human resource component of the health and community services system in the Labrador Region reflects many important characteristics of the system as a whole. Nurses make up the largest group of professionals and are essential in nearly every aspect of the health and community services system. As with the rest of the Province, there is a concern that the nursing workforce is aging without adequate reserves to minimize the impact of significant retirements. Twenty percent of front-line nurses in the Labrador Region are 45 years of age or older. This is less than the provincial percentage of 26 percent, but still of concern, particularly in a region where recruitment is notoriously difficult. Most of the other professional groups in Labrador reflect this same trend, with a workforce that is younger than that of the Province as a whole. Licensed Practical Nurses are the exception, with over 45 percent (vs. 39% for the Province) of their group being older. There are also some clear gaps in the human resource supply for a number of program areas. This limits the system’s ability to deliver an adequate level and range of services. The absence of psychologists is most obvious. Other professions, such as occupational therapy and physiotherapy, are also in short supply and this poses many challenges for the health and community services system as well as for those seeking services. This is a long-standing, and unresolved, situation that is experienced in different ways in all regions of the Province.

![Proportion of Unionized Employees 45+ (1999)](source: Human Resource Sector Study, Department of Health & Community Services)
There are approximately 25 practicing physicians in the Labrador Region. This represents 2.7 percent of the total number of doctors in the Province. The ratio of general practitioners to specialists in the Labrador Region is significantly different from that of the Province as a whole, with a greater number of general practitioners compared with specialists. This difference is an interesting one to explore further when provincial standards for service locations are determined.

### Personal Health Practices and Coping Skills

Social environments that enable and support healthy choices and lifestyles, as well as people’s knowledge, intentions, behaviours and coping skills for dealing with life in healthy ways, are key influences on health. Through research in areas such as heart disease and disadvantaged childhood, there is more evidence that powerful biochemical and physiological pathways link the individual socioeconomic experience to vascular conditions and other adverse health events.

One’s personal habits in areas such as smoking, drinking, eating, and routine exercise have been shown to have a significant impact on one’s health. Results of the National Population Health Survey (1996/97), which surveyed individuals age 12 and over, provide us with some provincial insight into these areas.

When asked about their smoking habits, 31 percent of respondents, as compared to 28 percent for the country as a whole, reported that they were currently smoking. Females were less likely to smoke than males and males were also more likely to have smoked in the past.

Major gender differences were seen in reported drinking, with males across the country being much more likely to report that they drink regularly (63% vs. 43%). For those who reported drinking, they were most likely to drink less than once a month. However, residents of the Province drink more frequently, overall, than the average Canadian. Eighteen percent (Canada: 12%) of Newfoundlanders and Labradorians reported drinking between one and three times a month and 10 percent (Canada: 6%) reported drinking more than once a week. When residents of the Province were questioned about the amount they drink, 28 percent of those who drink alcoholic beverages reported that they drink less than one drink a week and 44 percent drink between one and six drinks a week, while 27 percent drink over seven drinks a week. These figures are similar for the country as a whole.

Routine physical activity has consistently been shown to be one way that people can achieve better overall health. Research by the Canadian Fitness and Life-styles Research Institute

Source: Department of Health & Community Services
has found that approximately 60 percent of Newfoundlanders and Labradorians are inactive. While this has improved since 1981 when the figure was 86 percent, it is still a concern for the Province. Two out of three people in this Province are still not active enough to achieve health benefits. Women are not as active as men and there is still an alarming incidence of childhood obesity all across Canada. Inactivity also decreases with higher levels of education and income. Four groups have been identified across Canada as being most at risk from inactivity: the poor, people of aboriginal/indigenous ancestry, children, and women.

The National Population Health Survey (1996/97) also looked at one’s body mass index (weight/height). For the country as whole, males (35%) were more likely to be overweight than females (23%) and females were much more likely to be underweight than males (14% vs. 3%). The percentage of individuals overweight in this Province (39%) was the second highest in the country. Given the low activity levels, the number of persons overweight, and our aging population, it is not surprising that we have the highest death rates due to circulatory disease in the country.

One other area where one’s personal practices can have an effect on one’s health is in the area of sexually transmitted diseases. Chlamydial infections are the most commonly reported sexually transmitted disease. Although the number of cases in the Province appear to have declined in the mid 1990’s, they seem to be on the rise again. It is difficult to determine though whether this is due to increased testing by physicians or actual increased incidence. Most cases reported are among females between the ages of 15 and 24. Incidence of gonorrhoea have become minimal and syphilis has disappeared in recent years.

Since reporting began in 1984, 205 (158 male and 47 female) cases of HIV infections have been registered across the Province. Of these, 82 (64 male and 18 female) have progressed to AIDS. While there was a significant increase in HIV/AIDS in the early to mid 1990’s, there appears to have been somewhat of a decline in the past few years. Most cases fall in the category of ‘men who have sex with men’, with ‘heterosexual activity’ coming in second. Of the 82 AIDS cases reported to date, 60 (51 male and 9 female) have resulted in death.

### Healthy Child Development

The effect of prenatal and early childhood experiences on subsequent health, well-being, coping skills and competence is very powerful. Children born in low-income families are more likely than those born to high-income families to have low birth weights, to eat less nutritious food and to have more difficulty in school.

Currently children under the age of 15 make up approximately 17 percent of the population of the Province (22% for the Labrador Region). There are approximately 89,508 children under the age of 15 in the Province, with 5,331 living in the Labrador Region. During 2000 there were 317 babies born to mothers from the Labrador Region and 4,847 in the Province as a whole.
When discussing an issue such as healthy child development it is hard to ignore the incidence of children in families on Income Support. During 2000, 1,535 families in the Labrador Region received Income Support at some point during the year. Over the past ten years, both the percentage of families on Income Support with children, and the total number of children on Income Support has dropped. In 1991 there were 1,750 children in 895 families on Income Support, compared to 1,310 children in 725 families in 2000, but the vast majority of this change can be accounted for by the overall drop in the number of children in the area, and across the Province as a whole.

A valuable service offered to families in this Province are the federally and provincially funded Family Resource Program sites located across the Province. These Programs focus on the promotion of well-being, emphasizing healthy child development and family functioning. Currently, there are 74 government funded Programs (including satellite sites) across the Province, with two of them being located in the Labrador Region. Research has also shown that access to regulated child care increases the likelihood of healthy child development. The Province currently has 133 licensed child care centres (with 5 or more spaces), which provide space for a total of 4,500 children full-time (or more part-time). Twelve of these licensed centres are located in the Labrador Region, providing space for 275 children full-time. The majority of the full-time spaces in child care centres are occupied by children under the age of five. There are currently 24,603 children under the age of five in the Province, with 1,593 in the Labrador Region.

The Child Youth and Family Services Act, proclaimed in January 2000 reflects a cultural shift in service delivery practices. Although the safety of the child remains paramount, new ways of intervening promote early intervention and greater emphasis on prevention activities. During 2000, there were 6,549 children under the age of 16 who received some form of protective intervention service because they were vulnerable to abuse and violence. Just under 49 percent were female. In addition, residential placements were provided for approximately 900 children and youth. This includes 228 children in continuous custody (i.e. permanent care), 302 youth over the age of 15 (who signed voluntary care agreements) and the remainder, 370, who were temporarily placed for short periods but are now back with family.

For the same period in the Labrador Region 716 children (50.3% female and 49.7% male) received protective services, which represents 10.9 percent of the provincial total. As well, for those receiving residential services, 21 children were in continuous custody and 8 were youth with voluntary agreements.

Children born to teenage mothers are at higher risk for any number of difficulties. Pregnancy during the teen years disrupts...
educational achievement for the young mother and places her in jeopardy of low educational outcomes, poverty, and other forms of social exclusion. Adolescent motherhood is also associated with lone parenting which often brings its own set of challenges. Although provincially, there has been a steady decrease in the number of children born to mothers age 15 to 19 (and very few births to mothers less than age 15) much of this can be accounted for by the declining number of 15 to 19 year-olds in the population as a whole. With this taken into account, a slight decline in the proportion of females age 15 to 19 across the Province having children is still evident. It should also be noted that provincially this trend is not restricted to teenage mothers. With this taken into account, a slight decline in the proportion of females age 15 to 19 having children is still evident but this trend is not evident in the Labrador Region, which continues to have the highest rate of births to teenage mothers in the Province. It should also be noted that the Labrador Region has not mirrored the rest of the Province when it comes to declining birth rates. While the Region saw a decline in birth rates during the early 1990's, the rate has been relatively stable since 1993.

Babies born to teenage mothers tend to have lower birth weights than those born to older mothers. Babies born less than 2,500 grams (or 5.5 lbs.) can have a number of health concerns and these health concerns may sometimes result in death. Provincially, the overall incidence of low birth weight babies has been decreasing since 1993, with the rate in Labrador (32.4/1,000 live births) being lower than that of the Province as a whole (49.5/1,000).

**Biology and Genetic Endowment**

*The basic biology and organic make-up of the human body are a fundamental determinant of health. Genetic endowment provides an inherited predisposition to a wide range of individual responses that affect health status. Although socioeconomic and environmental factors are important determinants of overall health, in some circumstances genetic endowment appears to predispose certain individuals to particular diseases or health problems.*

The National Population Health Surveys have shown that there is a link between family history and heart disease. They found that people over the age of 20 are more likely to be diagnosed with heart disease if they have a family history of the disease.

Diseases of the circulatory system are a major concern in this Province as they are the leading cause of death by disease and Newfoundlanders and Labradorians have the highest death rates due to diseases of the circulatory system in the country. The rate of deaths due to diseases of the circulatory system

has been relatively constant since 1986, with males being consistently more likely to die due to this cause than females. While rates of death due to neoplasms (cancers), diseases of the respiratory system, and endocrine and immunity diseases have been sporadic in the Region, males have been more likely to die of these causes than females. Residents of the Labrador Region, overall, have been less likely to die of any of these diseases than residents of the Province as a whole. This is not surprising given that the death rates in the Region remain the lowest in the Province, tied to the low numbers of individuals over the age of 50 who are more likely to be diagnosed with many of the more prevalent diseases and conditions.

According to the National Population Health Survey (1996/97), incidence of diagnosed chronic health conditions were similar in the Province to that of the country except for incidence of allergies. Residents of the Province were less likely to have non-food allergies (15% vs. 22%) and food allergies (4% vs. 7%). Other common conditions in the Province included: arthritis/rheumatism (14%), back problems (11%), high blood pressure (11%), migraines (6%), and asthma (5%). The survey also found that Newfoundlanders and Labradorians have the second highest self-rated health status in the country, with 26 percent rating their health as excellent and 65 percent rating their health as good or very good. However, life expectancy remains among the lowest in the country (NF: 77.7 years at birth, Canada 78.6 years at birth). As is the case across the country, women (80.5 years) in the Province tend to live longer than men (75.0 years).

According to Statistics Canada’s Health and Activity Limitation Survey (1991) ten percent of the population (approx. 57,953 people) of Newfoundland and Labrador has some form of physical or mental disability. This rate is highest among individuals over age 65 (41.4% or approx. 23,086 people). As of 1991, 97.5 percent of individuals under the age of 65 with disabilities were residing in households (2.5% were residing in institutions) compared to 85.6 percent for those age 65 or older (14.4% were residing in institutions). As a result of de-institutionalization, persons with disabilities now receive supports allowing them to reside in the community.

**Social Environments**

The array of values and norms of a society influence in varying ways the health and well-being of individuals and populations. In addition, social stability, recognition of diversity, safety, good working relationships, and cohesive communities provide a supportive society that reduces or avoids many potential risks to good health. Studies have shown that low availability of emotional support and low social participation have a negative impact on health and well-being.

Results from the 1996 census provide us with a profile of the family characteristics throughout the Region and the Province. Family sizes in this Province tend to be small with two-person families comprising 36.8 percent of all families, three-person families at 26.2 percent, four-person families at 25.8 percent, and five or more person families comprising only 11.1
percent. In the Labrador Region, there is a slight tendency toward larger families. The vast majority of families in Newfoundland and Labrador continue to be husband-wife families, with over 90 percent of them being married (84% in the Labrador Region). Lone-parent families comprise 13.1 percent of all families in the Province and 11.8 percent in the Labrador Region, with the majority having only one child.

Income Support statistics indicate that while the proportion of households headed by youth under the age of 25 availing of Income Support has continued to decrease over the last several years, nearly 20 percent continue to be headed by youth. (Note: a household may contain only one individual.) This rate is even higher in the Labrador Region, at 32 percent. It should be noted though that this may not be surprising given the higher proportion of youth in the Region. As a result of the new Child, Youth and Family Services Act, the Health and Community Services and Integrated Boards also have legislative authority to enter into agreements to provide services to youth age 16 and 17. In Newfoundland and Labrador there are 303 youths in receipt of residential services to live independently (8 in Labrador) and 28 who continue to live at home (1 in Labrador), but receive intervention services.

Incidence of crime, especially violent crime, in an area also affects one’s health and well-being. Newfoundland and Labrador continues to have the lowest overall crime rate in the country and the fourth lowest rate of violent crime; behind Quebec, Prince Edward Island, and Ontario. While the Province continues to have low rates of homicide, attempted murder, abduction, and robbery, our assault rate is higher than the national average. This is particularly noticeable when it comes to sexual assault.

During 2000/01, there were 201 incarcerations from Provincial Courts in the Labrador Region. The rate (10.5 per 1,000 population) of incarcerations was the highest in the Province and significantly higher than for the Province as a whole (3.0 per 1,000). Youths aged 15 to 24 comprised 37.3 percent (NF: 27.3%) of all incarcerations, while individuals over the age of 54 accounted for only 3.5 percent (NF: 5.8%).
Support from families, friends and communities is associated with better health. The importance of effective responses to stress and having the support of family and friends provides a caring and supportive relationship that seems to act as a buffer against health problems.

Newfoundlanders and Labradorians are among the most generous and caring in the country when it comes to donating their time and money. According to Statistics Canada’s recently released document, Caring Canadians, Involved Canadians, the residents of this Province lead the country in volunteer hours, with the average volunteer giving 206 hours of their time annually; compared to a national average of 162 hours. Provincially, 31 percent of the population gives of their time to volunteer activities. This again, is higher than the national average of 26.7 percent. Additionally, eight out of ten Canadians reported that they contributed time, on their own, to assist people outside their household with basic activities such as: shopping, driving to appointments or stores, housework, baby-sitting and doing home maintenance or yard work for others.

What is of concern, is that between 1997 and 2000 there was a notable decrease across the country in the number of individuals volunteering, while those volunteering were giving more hours. This may have some considerable implications for the future of a province, such as ours, that has relied heavily on unpaid supports both within and outside of the family. It is already apparent that it is difficult to recruit new volunteers and those who are volunteering are stressed to the limits. This needs to be taken as a caution to not take volunteer support for granted, assuming that we can count on a sustainable volunteer base into the future, and to be cautious that our volunteers are not taking on too much and, as a result, jeopardizing their own health and well-being.

According to the National Advisory Council on Aging, relatives and friends provide between 75 and 80 percent of all personal care in Canada. The vast majority of these caregivers are women and a large number are over the age of 60. The health system has always depended on these informal caregivers to provide a certain amount of care and they are an integral part of our communities. Again, the concern is that these people are getting older and are often taking on too much.

In addition to social supports received through one’s family and friends, people often receive comfort and support through being a member of an organization or group. Like Canadians in general, just over 50 percent of Newfoundlanders and Labradorians aged 15 and older are members of an organization or group. These groups often play a vital role to people, especially in times of stress, and serve to strengthen communities as a whole.
Education

Health status improves with level of education. Education increases opportunities for income and job security, and equips people with a sense of control over life circumstances - key factors that influence health.

The secondary school system in the Labrador Region consists mainly of the Labrador School District. There are also three schools operated by the Conseil Scolaire Francophone Provincial School District (2 located in Happy Valley-Goose Bay and 1 in Labrador City) and one private school in Churchill Falls. The Labrador Region has a total of 22 public schools and one private school. The Region also has two public post-secondary education facilities. The public college, the College of the North Atlantic, has campuses in Labrador City and Happy Valley-Goose Bay. The campus in Labrador City also offers the College-University Transfer Program. There are two private college campuses in the Region, operated by: Keyin College (Labrador City) and CompuCollege School of Business (Happy Valley-Goose Bay).

High school pass rates across the Province have risen steadily from 63.5 percent in 1988/89 to 90.4 percent in 1999/2000. This represents an overall increase of nearly 27 percentage points in the last 12 years. For 1999/2000, the high school pass rate for the Labrador Region was comparable to that of the Province as a whole, at 89.8 percent.

According to the 1996 census, 37 percent of individuals in the Labrador Region had less than a high school education. This is eight percent lower than the Provincial figure of 45 percent. In the Labrador Region, there is a higher percentage of individuals who have achieved a trade or non-university diploma. This is indicative of the industrial structure of Labrador City, Happy Valley-Goose Bay and Churchill Falls, where relatively high numbers of trades people are required.
Income and Social Status

Health status improves at each step up the income and social hierarchy. High income determines living conditions such as safe housing and ability to buy sufficient good food. The healthiest populations are those in societies which are prosperous and have an equitable distribution of wealth.

Personal income in the Labrador Region is higher than that of the Province as a whole. There are lower proportions of individuals earning less than 30,000 dollars a year and higher proportions earning more than 40,000 dollars a year. One clear determinant of income level that continues to be seen is educational attainment. The higher an individual’s educational attainment, the greater likelihood that they will be in a higher income bracket.

Personal income includes income obtained through the various social transfers such as: Old Age Security, Canada Pension Plan, Child Tax Benefits, GST Credit, Employment Insurance, Workers Compensation, Income Support, and NCARP/TAGS. In 1998, only 10.5 percent of the personal income in the Labrador Region was from social transfers, as opposed to 25 percent for the Province as a whole. There are generally lower proportions in most areas, with the most notable differences in the Region being in Old Age Security, Canada Pension Plan and Employment Insurance, tied to a younger population and very low levels of seasonal employment. Incidence of Income Support in the Labrador Region is slightly lower than that for the Province as a whole, with 14.8 percent of individuals in the Region being in receipt of Income Support at some point in time during 1998.
Employment and Working Conditions

Unemployment, underemployment and stressful work are associated with poorer health. People who have more control over their work circumstances and fewer stress related demands of the job are healthier and often live longer than those in more stressful or riskier work and activities.

According to the Newfoundland and Labrador Labour Activity Survey, the average weekly employment rate in 1999 for the working age population (18-64) in the Labrador Region was the highest in the Province at 72 percent, compared to 59 percent for the Province as a whole. Seasonality was also only minimal in the Region, with employment ranging from 70 percent in the winter to 74 percent during the fall. Of the working age population in the Region, 81.9 percent (NF: 72%) worked at some time during the year and 12.3 percent (NF: 18%) collected Employment Insurance at some point during the year.

Not surprisingly, educational attainment was shown to be a major contributing factor to the employment rate, with those having completed a post-secondary program being significantly more likely to be working. The major employers in the Labrador Region were in the areas of mining and oil and gas extraction, public administration, educational services, health care and social services, retail trade, construction, utilities, accommodation and food services, and transportation and warehousing.

One’s age, gender, industry and occupation are all determinants of workplace injury. The average age at which a worker becomes injured in the Province is age 37 and frequency of injury declines with age, while clinical severity generally increases. Work-related injuries occur at higher rates in men. Over the 10-year period from 1989 to 1998, 69.6 percent of all lost-time claims were registered by males. During the same period, 49.3 percent of all lost-time injuries occurred in the service industry. This is not surprising given that over 60 percent of all provincial employers are classified in this category. The risk of injury is also dependent on one’s occupation. The labouring profession has had the highest frequency of injury, with 12.1 percent of claims being registered by workers involved in labour and elemental work. Another interesting finding is that, in general, hourly paid employees have significantly higher rates of injury than salaried employees. Overall, the majority of claims are due to sprains and strains, primarily of the musculoskeletal origin, with the most common being back injury.

Physical Environments

Physical factors in the natural environment (e.g., air, water quality) are key influences on health. Factors in the human-built environment such as housing, workplace safety, community and road design are also important influences.
The 1996 Census found that the degree of home ownership is very high in Newfoundland and Labrador, with 77 percent of individuals owning their homes. In the Labrador Region, the rate of home ownership is somewhat lower, at 66 percent. For those owning their homes, the average monthly payment (including heat, light & municipal taxes) in the Labrador Region was slightly lower than that for the Province as a whole ($426 and $469, respectively), as were average monthly rental payments (including heat, light & any applicable municipal taxes) ($429 and $498, respectively).

As indicated in the previous section, the type of occupation one has and the sector one works in are also important determinants of one’s health and well-being. An individual who works in a labouring profession and/or works in the service industry may be at a higher risk of injury.

Undoubtedly, the quality of the drinking water in a community is a concern for residents. While people often see water advisories as a concern for their health, illnesses due to water impurities are very rare in this Province. Although there are approximately 392 water supplies that currently have boil water advisories in affect (figures are as of September 26, 2001), these are precautionary measures and once the water is boiled it is completely safe for consumption.

Advisories currently affect approximately 259 communities across the Province. The advisories are typically put into effect due to inadequate disinfection, inadequate chlorine levels, or unsatisfactory bacteriological test results. In the Labrador Region there are currently six water supplies with boil water advisories affecting five communities.

An additional water quality issue that affects people’s drinking water is Trihalomethanes (THMs). Out of the 333 tested water supplies across the Province, 70 do not conform to Health Canada guidelines of 100 micrograms per litre for THMs, while all other chemical testing indicates very good water quality. None of the water supplies tested with high levels of THMs are in the Labrador Region. Efforts are currently under way to mitigate against high THMs levels for the communities in which they have been identified.

---

**Gender**

*Gender refers to the array of society-determined roles, personality traits, attitudes, behaviours, values, relative power and influence that society ascribes to the two sexes on a differential basis. "Gendered" norms influence the health system's practices and priorities. Many health issues are a function of gender-based social status or roles. Women, for example, are more vulnerable to gender-based sexual or physical violence, low income, lone parenthood, gender-based causes of exposure to health risks and threats (e.g., accidents, STDs, suicide, smoking, substance abuse, prescription drugs, physical inactivity). Measures to address gender inequality and gender bias within and beyond the health system will improve population health.*
High school pass rates continue to be substantially higher among females than males, and this remains a considerable source of concern. While the pass rate for males has risen over the past 12 years, there is still a very noticeable gap. This gender difference was most noticeable in the Labrador Region in 2000, with the pass rate for females being 94.6 percent compared to 85.2 percent for males.

While historically, overall differences in educational attainment throughout the population were apparent between males and females, this overall difference has all but disappeared in the Labrador Region, and for the Province as a whole. However, more recent provincial data indicate that females between the ages of 25 and 39 are more likely to have completed a post-secondary education and overall, females are less likely to have very low levels of education (8 years or less). Although females have made considerable progress in the area of educational attainment, significant differences still remain in levels of income both within the Labrador Region, and across the Province as a whole. This is not specific to the Province and remains an issue of national and international concern. Significantly higher proportions of females remain in the lowest income brackets and few achieve the higher incomes. As of 1998, females across the Province continued to earn an average of 42 percent less than men. Additionally, when one looks at employment rates in the population, women in the Labrador Region were 21 percent less likely to be employed than men. These factors have significant implications for women, especially as they enter into their pensionable years.

Women continue to be the major caregivers in our Province, both informal and formal. The large majority of front-line health professionals (nurses, social workers, and licensed practical nurses) are women and women continue to provide the vast majority of personal care through home support services and unpaid support to relatives and friends. Additionally, women live longer and may require personal care themselves for longer periods of time. This, coupled with gender differences in income and employment, may have a significant impact for the futures of women in this Province and the country as a whole.
Culture

Some persons or groups may face additional health risks due to a socio-economic environment, which is largely determined by dominant cultural values that contribute to the perpetuation of conditions such as marginalization, stigmatization, loss or devaluation of language and culture and lack of access to culturally appropriate health care and services.

While the Province has a broad cultural diversity, historically, having been settled by peoples from all over the globe, English is by far the most common language spoken in homes across the Province (98.5%); with small proportions of the population speaking French (0.4%), Aboriginal languages (0.3%), Germanic languages (0.15%), Chinese (0.13%), and other languages (0.52%). The cultural diversity in this Province is more widely seen through the variety of traditions and religious practices throughout the Province.

The Labrador Region is rich in aboriginal culture, with three diverse groups of aboriginals living throughout the Region; the Inuit, Innu and Metis. These groups portray the deep cultural heritage of the Region.

Approximately 1,600 Innu live in the communities of Sheshatshiu (1,000) and Davis Inlet (600). The federal government is currently involved in the relocation of the Innu in Davis Inlet to Sango Bay (Natuashish), and the subsequent creation of reserves in Sheshatshiu and Natuashish. Approximately 2,500 Inuit live in five coastal communities in northern Labrador: Rigolet, Postville, Makkovik, Hopedale, and Nain, while approximately 2,000 reside in Happy Valley-Goose Bay and Northwest River. The Innu and Inuit have separate direct funding agreements with the federal government for primarily non-insured health services and programs and through their own independent health boards provide services to their members that are not available to non-aboriginal people. The Labrador Inuit Association (LIA) has recently signed an Agreement-In-Principle with the Province on the Inuit Land Claim, which will result in the transfer of jurisdiction over health services to the Inuit Central Government, and devolve health care services to the Inuit Central Government. Self-government negotiations with the Innu have been suspended until the process of reserve creation and registration is complete. The approximately 5,000 Labrador Metis, the descendants of Inuit and European settlers, live in the communities of Happy Valley-Goose Bay, and 14 small communities on the south coast of Labrador. This group does not have a direct funding agreement with the federal government.

Conclusion

The Labrador Region is a beautiful and mysterious region that is unique in its characteristics, composition and landscape. Its integrated regional health board and three Aboriginal health commissions provide health and community services to a younger and very diverse population
over a vast and breathtaking geographic area. We have much to learn from the Labrador Region that can be of benefit to the entire Province. Our provincial health and community services system has been, and will continue to be, improved as a result of the commitment and efforts of the many individuals and groups from the Region. The people of the Labrador Region know that their continued involvement is critical to the decision making process facing the health sector today. Please continue to make your views known, as successful outcomes will be achieved if we all work together. If you would like to provide any further input into this process, please fell free to respond to Reaching Consensus and Planning Ahead.

Acknowledgments

This document was made possible through the efforts of not only the Department of Health and Community Services but many other Departments and Agencies. We would like to express a special thank you to the Newfoundland Statistics Agency, Economics and Statistics Branch, Department of Finance, and the Newfoundland and Labrador Centre for Health Information; who dedicated many hours to compiling the data contained throughout this document.

We would also like to thank the following individuals and groups who provided us with information from their area and/or assistance with the document preparation:

- Planning and Evaluation Division, Department of Health and Community Services
- Financial Services Division, Department of Health and Community Services
- Disease Control and Epidemiology Division, Department of Health and Community Services
- Economic Research Division, Economics and Statistics Branch, Department of Finance
- Corporate Planning and Research Division, Department of Education
- Department of Justice
- Sport Newfoundland and Labrador
- Labrador and Aboriginal Affairs
- Workplace Health and Safety Compensation Commission
- Department of Environment

Our thanks go out to the Strategic Social Plan Regions for hosting Health Forums 2001 and to the Regional Health Boards for their input and support.
